The kidney is a double functional organ: one of its functions is to regulate water and salt balance, whereas its second function is to perform its essential function, i.e. to produce urine. If the kidney is not functioning, this, in itself, has two consequences: (1) a loss of water and salt balance; and (2) loss of urine. From a clinical viewpoint, it is important to note that these consequences are only seen on a chronic basis and that they do not constitute life-threatening conditions.Q: How to use async await in AngularJS to perform a server-side action from the frontend? I am working on a AngularJS frontend with AngularFire 2 and an ASP.NET Core API. The API calls a server-side business logic (also written in ASP.NET Core) in order to perform some actions. The problem is that the API is not returning the result of the business logic call immediately. In fact, it could take a long time to perform the server-side business logic. The only way I can get the result of the call to the business logic is to call the API again to get the result of the business logic. The question is: How can I use async/await in AngularJS in order to get the result of the server-side call to the business logic without making the API call again? EDIT I have read the following answers, which seem to solve the problem, but I would like to a1d647c40b

Open Autodesk Autocad and click on AutoCAD itself. Scroll down and select -> File -> Make File folder for newly created Autocad. Press OK button. Now open the folder and create a folder name as and put your activation key file in it. For Eg: if you want to use activation key 123456 you have to put your activation key file in folder and name as 123456. This invention relates generally to a brake dust collector, and more particularly, to a flexible water duct positioned on a brake dust collector for capturing and collecting dust particles dislodged from a vehicle brake. Brake dust collectors are known. One such dust collector is disclosed in U.S. Pat. No. 5,947,011 to Brooks. This device includes an elongate manifold with a cylindrical portion of reduced diameter having an axial opening. The outlet end of the cylindrical portion is coupled to a continuous slot in the axial opening of the manifold. The inlet end of the cylindrical portion has a plurality of radially spaced outlet openings which are coaxial with the inlet end of the cylindrical portion. A plurality of housing assemblies are coupled to the manifold and have openings that align with the outlet openings of the manifold. Each housing assembly is pivotally mounted to the manifold so that it can be selectively pivoted relative to the manifold. A housing cover is coupled to the housing assemblies and encloses the outlet openings of the manifold. The housing assemblies are structured to receive an opening to allow for free access to the outlet openings of the manifold. The housing assemblies may be pivoted to an open position where dust may be discharged from the outlet openings. The housing assemblies may also be pivoted to a closed position where dust is captured by the housing assemblies. Although the above dust collector works satisfactorily for many applications, the present inventor has determined that it may be improved. In particular, the housing assemblies are relatively bulky and the housing cover takes up a substantial amount of floor space. Also, the outlet openings of the cylindrical portion of the manifold are angled. This results in greater forces being applied to the outlet openings of the manifold. The greater forces may result in premature fatigue and failure of the manifold and/or the connector coupling the manifold to the outlet end of the cylindrical portion of the manifold. Further, the opening through the housing assemblies, housing cover, and manifold
