The contents of phytic acid (PA) in wheat flour, wheat-flour derived porridges, and mung bean (Vigna radiata) flour porridges were investigated. Grains from two varieties of wheat and mung bean were used in the experiment. Grains were ground and PA content determined by acid-perchloric and enzymatic methods. PA content of wheat and mung bean porridges were calculated using regression analysis. A positive linear relationship was found between PA content of the wheat flour and the PA content of mung bean porridges. On the other hand, no such relationship was observed for the other matrices. The relationship between PA content of porridges and the PA content of mung bean flour suggests that PA in porridges is mainly due to mung bean flour. The acid-perchloric method was the only method used in the study which could detect PA in wheat flour, and thus results should be interpreted with caution.Q: ASP.NET MVC GetID request on controller I've searched everywhere but couldn't find any answer.
