NeSSi2 is a free and open source application that you can use in order to monitor your network and enhance its security. You need to connect to the net to use eNOS, but some networks and ISPs lock out eNOS. If eNOS is locked out, you can use eNOS2 to monitor your network. eNOS2 is designed to run on a traditional PC that does not have an IP address. eNOS2 can monitor eNOS, too, making it a good companion to eNOS. You can use eNOS2 in two ways: as a passive network analyzer or as an active host. Either way is useful. You can use the passive mode to find out which networks and ISPs block eNOS. You can use the active mode to run eNOS2 as a host so that it connects to eNOS on your network. Features: - CPU and network monitor - Port monitor - Ping statistics - Packet sniffer - Host/Network interface management - File and folder operations - Tools for managing packages - Network and packet information eNOS2 Homepage: For help and more details, visit the eNOS2 project page: Determine what systems or programs are using excessive network bandwidth and resources. Monitor performance and adjust settings to increase productivity. Click on the System Center icon to

start the network performance utility. The tool shows data in graphical and tabular formats. Clicking on the Network Advisor tab shows information about network hardware and drivers, applications that use network resources, and programs that use network resources. Monitor the use of resources by selecting network connections and applications, and then clicking on the Show Details button. You can filter information on an application or connection basis, or see network performance at a system level. System Center Network Performance tool features: • Saves real-time network performance and alert information. • Analyzes traffic flows and usage of network resources. • Generates reports and graphs to help you plan network infrastructure and identify resource shortages and bottlenecks. • Determines physical location of network equipment by IP address. • Identifies network elements and devices that are using network resources. • Identifies performance bottlenecks and determines when programs are the cause of network
