A: Yes: Probably a crack, but definitely a cracking tool used with the crack. And probably a very expensive tool. Q: How to control #PREFIX in a #VI in Emacs I'd like to have a way of adjusting the prefix used in the shell completion of a vi for a given buffer. This usually seems to be the relevant part of.emacs: ;; A nil value here disables completion. (setq completion-ignore-case t) (setq default-directory "~/Documents") (setq load-path (cons "~/Desktop" load-path)) (setq completion-ignore-case t) disables the case-sensitivity for completion. but I need to have the case-sensitivity enabled; for some reason even with that in.emacs and the + set for bash it doesn't work properly. I've tried (custom-set-variables '(completion-ignore-case t)) in.emacs, and bind-key -n'shell-command-on-completion ":set" "t" in.bashrc; both do not work. If I move the line to.bashrc it works fine, but it's not intended to be applied to sub-shells (i.e. other shells may already have their own completion). I also tried (in my.bashrc) export

COMPL_IGNORE_CASE=t but that also does not seem to work. (Funny sidenote: the line that sets completion-ignore-case in.bashrc is already commented out.) I'm running Emacs 24.3 on Debian 7.0 from an AMD box, if that's relevant at all. Any ideas? A: This is a duplicate of the question Emacs completions ignoring case. Note that the question is actually about completion in a shell where case isn't considered. As you've found out, the answer to the question doesn't apply to other shells. This answer isn't about any shell, it's about setting up case-insensitive shell-completion. Q: Is mining the blockchains of different bitcoin clients the same? Is mining the blockchains of different bitcoin clients (e.g. Core and Classic) the same, or are there any differences 3e33713323
