Cancer pain is one of the most common types of pain reported by cancer patients. A review of the literature was conducted to identify barriers to implementation of education programs to improve cancer pain control. The literature review included five computer-based search engines, computerized bibliographic indexing, and hand searches of the references of retrieved articles. These searches resulted in 2,286 articles. A hand search of references of selected articles and review of literature yielded eight additional articles. A final sample of 14 publications provided sufficient information to address three domains of the literature review: (1) pain assessment; (2) education and interventions; and (3) barriers.
