

Change File Time is a lightweight application designed with a single goal in mind: to help users change the time attributes for files and folders, namely last created, accessed or written time stamps. Since this is a portable program, it is important to mention that it doesn't leave any traces in the Windows Registry, and you can copy it on any USB flash drive or other devices, and take it with you whenever you need to perform this type of file management operations on the fly. The user interface is really simplistic and packs only a few configurable settings. Unfortunately, you cannot use the "drag and drop" support for adding files to the list, so you should use the built-in browse button instead. Change File Time supports batch processing, which means you can add an entire folder to the list and apply time stamps operations in the same time. Once you have added a file to the list, the application automatically displays the information about it, namely creation date, when it was last accessed or written, and time details (year, month, date, hour, minutes, seconds and milliseconds). You can edit the time parameters manually by simply entering the values in the dedicated dialogs. On the downside, there is no help manual that contains information about the function of each built-in parameter. Although at a first glance it may seem easy to work with this tool, it is not, as it may prove to be pretty difficult for a rookie to configure the dedicated parameters. However, Change File Time does what it says and manages to remain light on the system resources, so it doesn't hamper system performance. Welcome to the Change File Time portable utility review for all your file time changing needs. Do you want to change the date, time, access time and last write time to a file or a folder? This is a portable application and it will allow you to change the time stamps of any file or folder. This means you can change the file time to an exact date, or make the file/folder accessible only to yourself, which means you could change the creation time, last access time and last write time of any file or folder. It's as simple as drag and drop file or folder and then double-click the program icon to begin the time stamp change wizard. You can also select multiple files at once by just selecting a folder. You have to know that this utility can only work on FAT/NTFS formatted files.
