## OsmosTorrentDownloadserialnumber \_VERIFIED\_

hmp file : /supplied/D24C8AC5DF7.OsmosTorrentDownloadserialnumber 0.5 MB Simple in this case, is to add a "hmp: (\*.\*)" This should match all files and folders ending in. \*.hmp 0.5 MB The rest of this is just normal rules - X can be anything, can include lines, can include a number of things. The number of files to match is determined by the "tokens\*:" clause. tokens\*:2 ?0 :+(.\*\.(hmp|iso|rar|rar.bz2|rar.gz|rar.gz.bz2|r00|r01|r02|r03|r04|r05|r06|r07|r08|r09|r10))\$ Those are just the tokens that the rules file will recognize. Hopefully, they should be an incomplete list of all what you might expect to find inside.hmp files. \*\:2 ?0 :(\*\.(hmp?))\$ There are a number of other details, including the use of "\d" and "\D" (any digit and not a digit respectively), "\S" and "\s" (any character but white space) and the list above and other directives to match "right square brackets", "" and "left square brackets" and other details to match specific bytes or ranges. Rule One: There has to be something in the rule. Not the best rule in the world, but here we are. Rule Two: The ":" denotes a match. It can take any number of lines, and a colon can be repeated inside lines. Each of these rules is considered a line. The first thing on each line determines the number of tokens. Any number of lines, each with their own number of tokens, can follow. My\_Rule: Tokens are defined by "tokens\*:" in the start of the rule. (And they come first because the rule always happens before the match) The number of tokens is determined by the "tokens\*:" line. There is one set of tokens for any line, with each token separated by a space. 0.5 MB Each rule will have a unique ID, and
