operator on the escape character. Example: \$1=\$5 +&" " + "5 +&" " + " " + &"A" + &"B"; &" " + "5  
+&" " + " " + &"A" + &"B" Output: A5 5A B5 A: Are you reusing \$1? Try: \$1=\$5 +" " + "5 +" " + " " +  
"A" + " " + "B"; The present invention relates to the field of electrical switchgear. More particularly,  
the invention is directed to a tubularly shaped, arc chute device formed at least in part of a thin-  
walled, substantially integral conductive tube and having an arc-suppression means formed on its  
interior. A typical electrical switchgear is generally fabricated as a series of interconnected sub-  
assemblies or modules. A cabinet of the switchgear, referred to as a base module, contains a plurality  
of switchgear modules. Typically, the base module is made of sheet-metal components with an  
external frame. The construction of the base module is such that it not only houses the components  
within, but also protects the components from various external hazards. These external hazards  
include, for example, severe weather conditions (e.g., a blasting wind), excessive heat, and projectiles  
(e.g., flying nails or screws). One of the internal components housed within the base module is an arc  
chute. An arc chute is used to direct the arcing current generated when a switch contacts open or a  
switch contacts close. This arcing current produces a certain amount of heat, thereby generating heat-  
induced stresses that stress the various components of the base module. As the components of the  
base module age, the heat-induced stresses caused by the arcing current are increased. Because the  
base module is typically configured to remain intact, the switchgear itself is deformed and may even  
fail. It would therefore
