Differential diagnosis of portal hypertension by a Doppler US method. To evaluate a new Doppler US method for the noninvasive detection of portal hypertension and to compare the results with the conventional splenoportography (SPG) in patients with clinically suspected splenic disease. Prospective case series. University hospital. Between March and August 2003, 43 patients (28 women, 15 men; mean age, 39.7 years; range, 15-63 years) suspected of having portal hypertension were included in this study. In 28 of these patients, SPG was performed. In the remaining 15, the Doppler US method was used. All patients had undergone ultrasonography and/or Doppler US studies of the portal vein before the SPG. The grading system proposed by the European Association for the Study of the Liver, and new Doppler US technique. The accuracy of the Doppler US method was compared with that of SPG. The Doppler US method detected a splenic vein thrombosis in 2 of the 15 patients. The results of the Doppler US method were negative in 5 patients who had no evidence of splenic vein thrombosis on SPG, and were false positive in 2 patients who had both normal SPG and Doppler US results.
