Q: Android not showing progress dialog when using async task I have an activity that has to start a network operation, and after the operation finishes, to show a dialog. Unfortunately, even though the network operation is correctly executed in the background, the dialog is never shown. The code in the activity is:

@Override protected void onCreate(Bundle savedInstanceState) {
super.onCreate(savedInstanceState); setContentView(R.layout.activity_main); //A lot of stuff...
new NetworkOperation().execute(); }
The class in charge of the network operation is:

@Override protected String doInBackground(String... params) { //A lot of stuff }
@Override protected void onPostExecute(String result) {
progressDialog.dismiss();

What's New In AutoCAD?

If you've ever used paper forms to provide feedback about your design work, then you know what it's like to create, review, and revise. By importing your digital forms into AutoCAD, you can integrate this feedback into your design work, without having to print and then annotate each form. The feedback that is imported into your drawing can consist of simple text or it can include 3D elements, color information, or any other data that can be captured. The information is drawn directly into the drawing, and any changes to the form are also included in the drawing. This makes it easier to incorporate changes and correct mistakes, without having to redraw everything. This information can be embedded into a drawing, shared as a PDF, or included in a cloud repository. You can import forms from many types of printers and software applications, including Adobe Acrobat, Microsoft Office documents, and a variety of online services. Importing the forms directly into your drawing is one way to get started with incorporating feedback into your design work. It's not always necessary to print out each form and then make corrections. You can incorporate feedback into your drawing using the Markup Import tool (Import > Markup Import) or the Markup Assist tool (Markup Assist > Markup Assist). These tools can be used for anything from creating a logo or artwork, to including links to digital files. You can also use these tools to import 3D models into your drawing and then use Autodesk Revit for 3D building. It's important to note that if you're using a non-Autodesk application for a form, you might need to use a separate tool to create an accurate print. For more information about importing printouts, see Printer Compatibility. When importing a document or cloud-based service, you can choose to import one or more forms at the same time. By combining different forms together, you can combine multiple inputs and more easily identify the type of input and its associated attributes. You can also see the size of the drawing and the amount of memory it requires. In addition to importing forms, you can also import block styles, text, and other content from applications like Adobe Illustrator and Photoshop. You can import directly into a drawing or add the content to a tool pallet or context-sensitive tool. You can even import from other applications by using the Autodesk Data Transfer Application, such as
