## Chefmate Plus Crack \TOP\

Notes: There are fewer sizes. Most notably, there is no 3 quart size. I have a 3.5 quart Chefmate, and I'm considering trading it in for the 14.5 quart, though I think I'll keep it for a backup since its not too hard to clean and store. I've read many a story of breakage but I've never broken one. If it does break, just wait for it to cool and crack it in half. If it does break, crack the other half. If it breaks in two halves, throw out half, and replace with a new half. If it breaks into one-eighth pieces (as with mine), throw out the broken pieces, and use the pieces that remain to make a new half. There are no special cleaners, because cast iron does not have any cleaning agents in it. Its simply an iron, and can just be cleaned like any other piece of kitchenware. You can use just about any kind of cleaning product you would use for plastic or stainless steel, but some products like abrasive cleaning pads can actually damage the surface of the cast iron and crack or chip it. Use care when cleaning cast iron, as it is a lot more sensitive than other types of cookware. If you're using an enameled pot to make soup or stock, it's important to follow a few guidelines to avoid cracking. First, make sure the pot you're using is large enough to hold the volume of liquid you're planning to cook. McAuliflower I think its those little plastic things that slide over the lip of the pot and keep the lid just off of contact. Im not sure what they are meant for if you flip the lid upside down to store maybe it prevents enamel chips Or keep airflow during storage I got three with my Chefmate and plan on keeping them for storage purposes.

## Chefmate Plus Crack

Also I think it's a big mistake to store your stone out in the elements. The higher your kitchen temperature is, the more moisture from foods cooking in the oven (or hearth) will gather in the stone, and if you store it in a hot, dry area, the

---

moisture will actually have time to evaporate out of the stone. Granted, you should be able to use your stone for a few months before it cracks, but if you take it out and don't use it for a few months, it's best to resoak it in warm, fresh water and let it dry thoroughly before storing it back in your

---

kitchen cabinets. You do want to be careful with this, though, because if your stone is stored too long and too often it will lose some of its heat-retaining properties. In my experience, a few months is probably the limit. if you put a cup of baking soda in the bottom of your stone and let it bake in your

---

oven over a couple of hours, your stone will heat up a little bit if you dont use it for a few weeks. maybe my stone actually cracked. Ok so - a new barbeque - in a new kitchen - and a new bigger pressure cooker. I read somewhere that you shouldn't put pressure cooker cookers in the fridge because

---

they may crack. I guess I'll have to live with that.

Now I have the perfect pizza stone for me, but if you want a guarantee that your stone won't crack, here is how to crack it. Take it apart in small sections and cut into two pieces (I did this because the cracks I got were along the seam of the two pieces). Invert it,

---

making sure the seam is facing the bottom. Place it upside down on a large baking sheet (wide is fine), and place another large baking sheet on top. Weight down by wrapping some heavy-duty aluminum foil around the stones and baking sheet. Put the whole thing into the fridge for 24 hours. That

---

way the moisture inside  
the stones will settle,  
and you can lift it out,  
flip it back over, and it  
should be crack-free.
