The NSA can only do what it is allowed to do. It has been repeatedly made clear that any violation of the 4th Amendment is a violation of the law, and a person who violates the law is subject to the consequences. The fact that the NSA has hacked into and transferred private phone records without an warrant in at least one case does not absolve them of the responsibility to follow the rules. The issue is not whether to follow the rules but whether they should be followed. If the NSA was feeling particularly evil, the NSA could simply have adopted the data retention policies and laws of the countries in which it performs its duties. So, what is the number one hackers tool? A bit of time and a USB thumb drive. All the information you need to compromise a system is already on the hard drive.

When a user plugs his USB thumb drive into his system, the system scans the drive for operating system, system drivers, virtual memory requirements, and system software. If all these things are already on the thumb drive, an attacker simply copies all the files from the drive to the system. Easy peasy! It gets even easier if the user chooses not to boot the drive. In addition to the 20 or so phones that were hacked, the N.S.A. claim to have built a bot capable of collating public phone records from more than 200 countries. Depending on how many people use the particular countrys public telephones, the data volume could be huge. And because it is aggregating data on how the world runs, information can be used to study history, track world events and, in the case of dissidents, expose them.

A successful attack will wreak havoc and wreak havoc on political campaigns. This is not the first time that someone has taken aim at political campaigns and in the process exposed information that could risk disrupting the entire electoral process. Some of the recent hacks, such as those involving the Democratic National Committee, Hillary Clinton, and John Podesta, aimed to manipulate or influence the election. This type of attack on election infrastructure attempts to sow doubt and discord and attempts to undermine the democratic process. Each aspect of these attacks can be replicated and executed. To put this in perspective: this hack seems to be relatively easy for an attacker who is familiar with Microsoft Windows systems. The phishing attack is fairly basic. The assumption of the malicious document is that the user has to open it. In this case, it attempts to exploit a Windows vulnerability in one of the web browser plug-ins. If you're an internal IT employee, you're likely familiar with how Windows computers and networks operate. So you'll know how to protect against many of the attacks we've talked about in this article. You can prevent most attacks by following common-sense practices and securing your network. You can prevent a phishing attack in the email client by reading an email that appears to be from your bank, credit card company, or other reputable business and which reminds you to keep up to date with notifications and requires a few mouse clicks to complete. A patch has been released for Microsoft Windows Server 2012 R2 that was released on July 10, 2016. This was a critical release that fixes several vulnerabilities in the OS, which most likely allowed the hacker to gain access to the server. To take action, you need to apply the update, either automatically or manually. 5ec8ef588b
